MG[®] Stapling System

Carton bottom staplers PERFECTA use preformed staples with special leg points. This MG[®] Stapling System has the advantage that the bent staple legs are clinched flat and properly on any smooth and hard support (clinching anvil).

The staple clinches within the under board without penetrating completely through. Such a "blind stitch" can be achieved with a reversible anvil (**2. B.H.** special version).

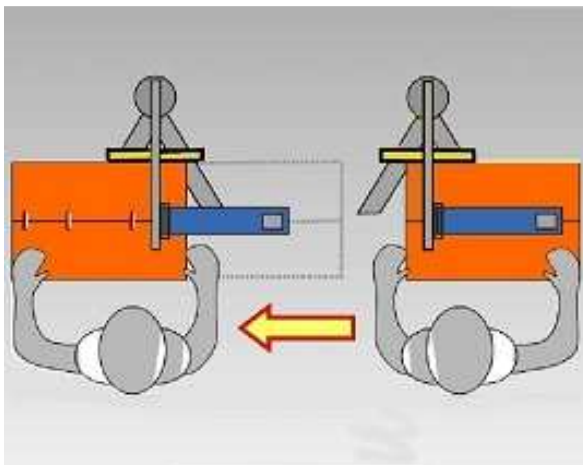

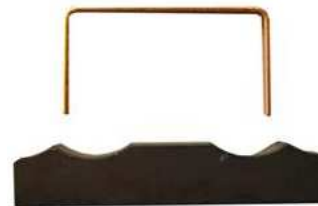

A simple support with a groove (**1. D.H.** standard version) has only the task to make space for the staple legs so they can clinch outside.

The staples bend around the cardboard, the legs lay flat and the tips are bent back into the cardboard.

This increases the stitching quality and prevents any risk of injury or damage to the box contents.

No need of semicircular bending grooves which must be adopted exactly to the staple outlet.

The model PERFECTA L (length stapling) has a laterally mounted stapling head and a rapidly adjustable carton guide stop which permits precise stapling over the carton flap joint without aiming.

Even very long boxes can be stapled. There is no need to turn the carton and the operator's position must not be changed. This means higher output and less staple consumption and also less wear and tear as well as higher efficiency.
